FACULTY OF SCIENCE & TECHNOLOGY

DEPT. OF COMPUTER SCIENCE & ENGINEERING (CSE)

Title: Event Management System Software Project

Course Code: CSE-3102

Course Name: DATABASE MANAGEMENT SYSTEM

Section: A

Group No: 06

Group Members:

Name	ID
Ayesa Begum	2252421043
Paromita Chanda	2252421089
Ishfar Bintey Haque	2252421107
Labiba Alam	2252421111
Nusrat Jahan	2252421121

Introduction:

Our Project Event Management System with the aim of managing the events with simplicity. With features for event booking, venue availability management, and customer feedback collecting, it is looking to bring its customers, event organizers, and venues into a single ecosystem. Users will easily be able to view and participate in events whenever they wish.

Project Idea:

The Event Management System offers a way to make event creation, management, and participation simpler. It is a platform for online listing for hosts to list their event, book an event, and get feedback.

On the other side, customers can check out all the events available, reserve a spot for themselves, and provide event feedback. However, the inclusion of a venue availability system can be the cure to customers and hosts to communicate with each other effectively.

Future developments are expected to include separate event sections, alert systems, and attendance tracking.

Design Of The Project:

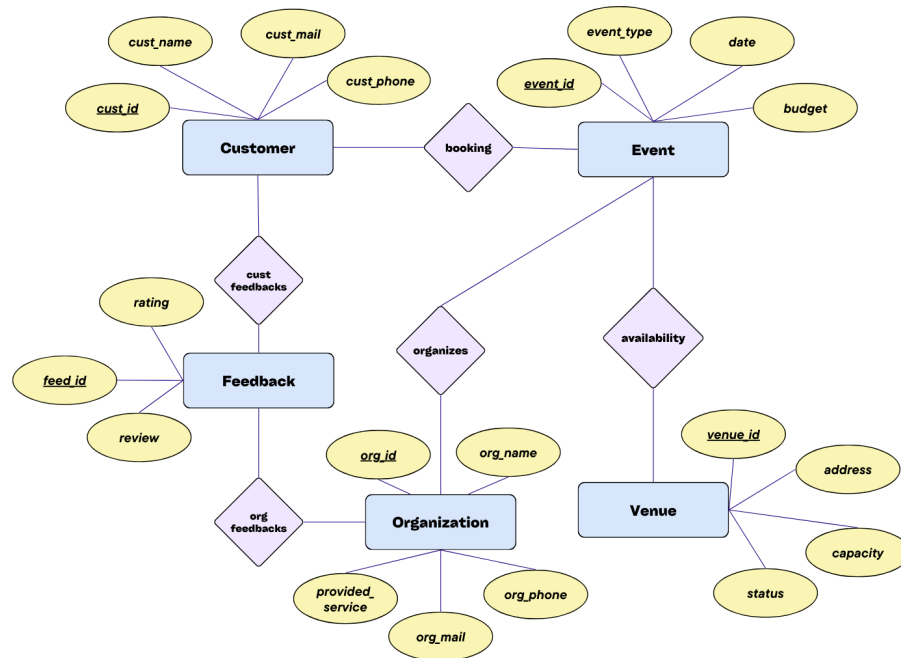

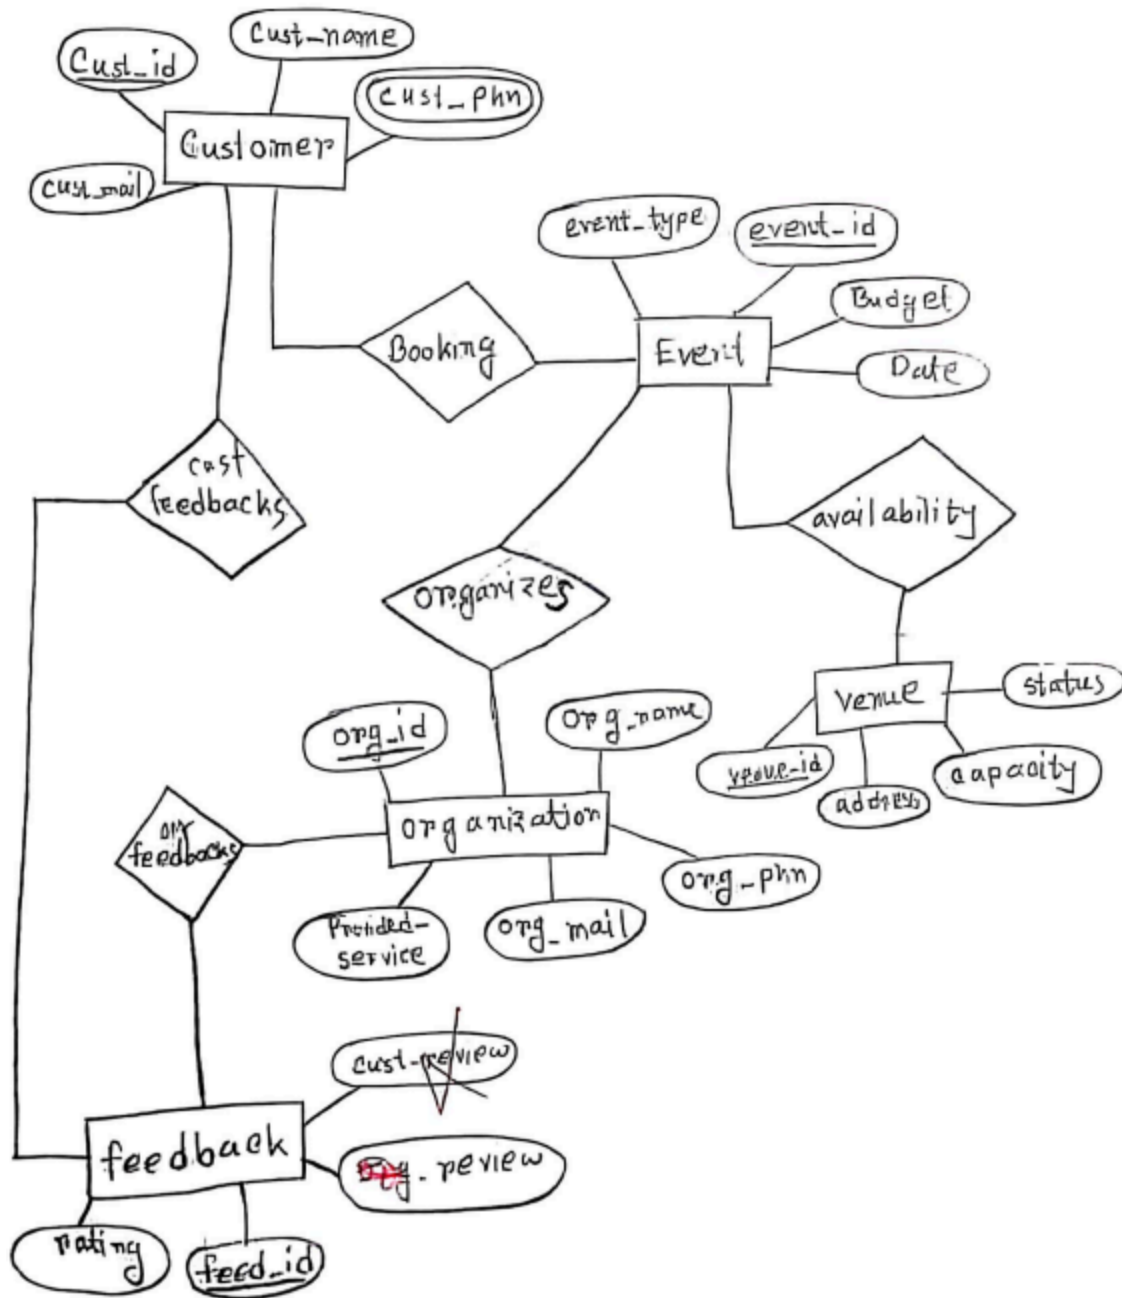

Fig: ER Diagram

ID - 43, 80, 107, 111, 121

and

Fig: Signed ER Diagram

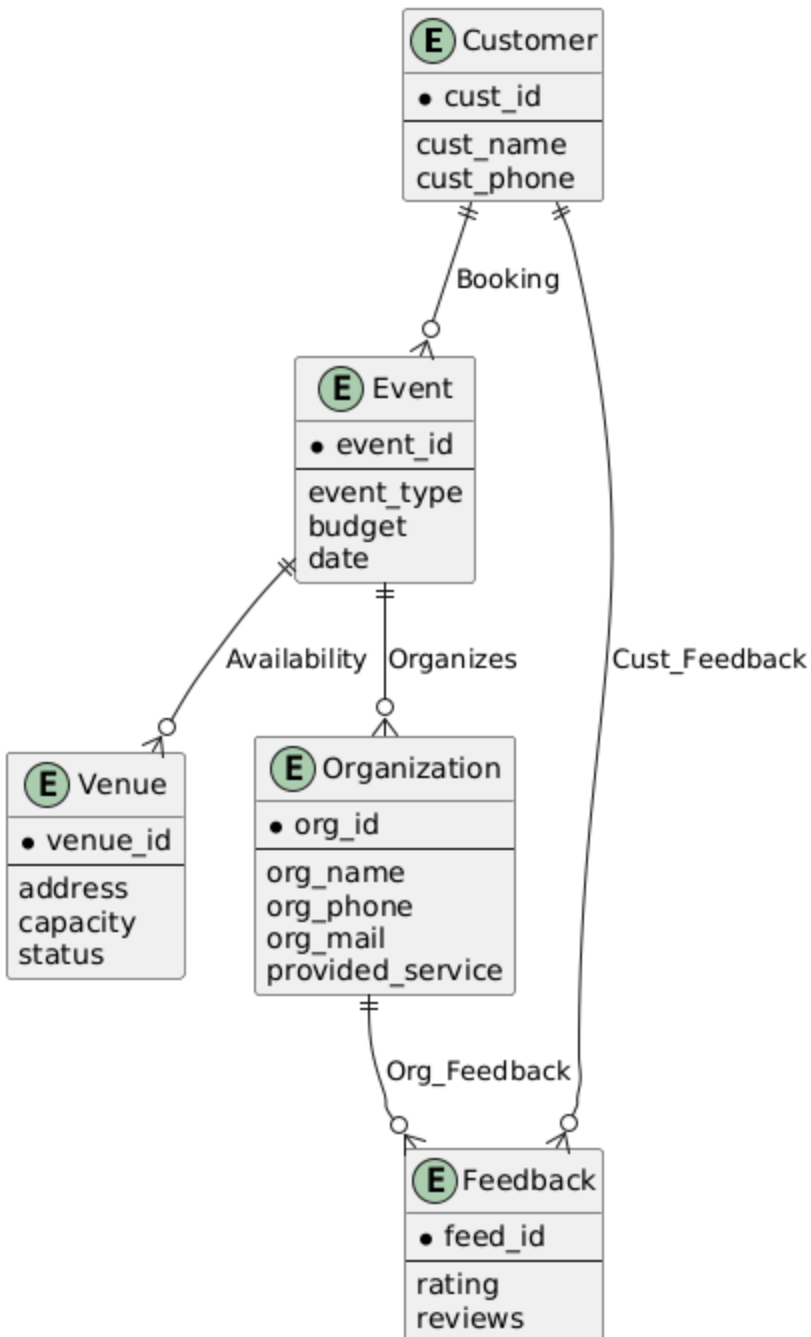

Fig: ER-Schema Diagram

Entities:

- Customer
- Event
- Venue
- Organization
- Feedback

Relationships:

- ❖ **Booking:** Between Customer and Event. A customer can book many events.
- ❖ **Availability:** Between Event and Venue. Each event takes place at a specific venue, and a venue may host multiple events.
- ❖ **Organizes:** Between Event and Organization. An organization can organize many events.
- ❖ **Org_Feedback:** Between Organization and Feedback. An organization can receive feedback from customers or participants.
- ❖ **Cust_Feedback:** Between Customer and Feedback. Customers can leave feedback for events or services.

This structure represents the main entities and how they interact with each other.

Development Of The Project:

The project started by finalizing our idea for an event management system. First, we built a simple PHP script to fetch customer data from a database, which helped us grasp the basics of PHP and SQL. Next, we mapped out the website layout, deciding where to place buttons like "Book Event" or "View Feedback" and outlining what each button should do when clicked (e.g., redirecting to a booking form or displaying event details). Once the design was clear, we coded

each button's functionality by writing SQL queries and linking them to PHP, ensuring actions like booking an event or submitting feedback worked smoothly. Along the way, we ran into issues like time format mismatches between the website and database, which required rewriting code to sync them properly. We also debugged how tables updated after user actions, tweaking queries to avoid errors. After weeks of testing and refining, the final system handled event bookings, organizer tasks, and feedback seamlessly, showcasing our team's ability to solve problems step by step.

Tools/Language/Software	Purpose
HTML	Used for the structure and content of the webpage.
CSS	Used for styling and layout of the page.
JavaScript	Used to submit form information asynchronously in real-time.
PHP	Used for handling server-side logic and interacting with the database.
MySQL	Database to store user information.
Xampp	Local server environment to run PHP and MySQL on localhost.
VS Code	Code editor for writing and editing project files.

Overview Of The Project:

Welcome to Our Website!

We are glad to have you here. Explore the site and get the most out of our services.

Contribution:

Ayesha Begum 2252421043	→ Proposed the project idea and created presentation slide on it. → Designed the Entity-Relationship (ER) diagram to represent the logical structure of the database, defining key entities along with their relationships. → Using this design implemented the database schema in MySQL, ensuring proper normalization and indexing for efficient data management along with Paromita Chanda. → Additionally, assist in integrating the database with the web application. also contributed ideas to enhance the project. → Furthermore, actively participated in testing and debugging the database functionality to ensure reliability and accuracy.
Paromita Chanda Joya 2252421089	→ Provided an idea of creating an online tutor finding platform for idea presentation and

	designed the slide to present it → Designed the Entity-Relationship (ER) diagram to represent the logical structure of the database, defining key entities and their relationships along with all members. → Led the design of the whole layout and plan for the website before implementing it → Queries for creating the tables and inserting data for initial database along with Ayesa Begum → Php code and sql queries for book event button (implemented logic for showing available events based on customer preference of budget and available or not booked date and time slots for that venue) → Php code and sql queries for checking feedbacks of that specific organizer before booking the event → Php code and sql queries for leave feedback, submitted feedback and received feedback functionality → Php code and sql queries for view history functionality for both customer and organizer → Php code and sql queries for delete event functionality for the organizer → Assisted in other buttons' functionalities and actively contributed to testing and debugging the database functionality → Assisted in the project report by writing the description part of development of the project and suggesting necessary changes
Ishfar Bintey Haque 2252421107	→ Designed the Entity-Relationship (ER) diagram to represent the logical structure of the database, defining key entities and their relationships along with all members. → Designed the whole layout and plan for the website before implementing it along with Paromita Chanda → Explained and Provided Guidance on PHP Workflow and Functionality to Team Members → Led the First Project Update(Fetching customer table's data), Including Initial System Setup, Database Design, and Core Features Implementation → Draw the ER Diagram for the Event Management System, Addressing all the Teacher's Feedback on the Initial Design

	→ Made Continuous Modifications and Improvements to the Codebase to Enhance Performance and Functionality → Developed and Established the Core Architecture and Structure of the website with php code. → Implemented a 24-Hour Time Format for Event Scheduling and Time Management using php code → Assisted in the Development and Integration of the Welcome, Login, Register Pages, and Event Booking Functionality in the Second Project Update(php code) → Helped Integrate and Consolidate Multiple PHP Files into a Single Unified PHP File for Simplified Code Management → Took Full Responsibility for Completing the Assignment Part of the Event Management System Project
Labiba Alam 2252421111	→ Authored the project report, ensuring clarity and comprehensiveness. → Proposed the innovative idea of incorporating a time slot for event booking. → Provided assistance in completing the project assignment effectively. → Suggested the HTML structure for the welcome, login, and registration pages. → Collaboratively designed the Entity-Relationship (ER) diagram with team members, defining the logical structure of the database, key entities, and their relationships. → Designed and created the conclusion, wrap-up, and summary sections of final presentation slides for the project. → Helped to solve problems faced by teammates during implementation, providing guidance and solutions.
Nusrat Jahan 2252421121	→ Provided an idea of creating an online blood donation platform for idea presentation and designed the slide to present it. → Designed the Entity-Relationship (ER) diagram to represent the logical structure of the database, defining key entities and their relationships along with all members.

	➔ Php code and sql queries for exploring events (customers can explore all types of events whenever they want.) ➔ Php code and sql queries for history (Both customer and organizer can see upcoming and completed events. Additionally, the organizer can see all created events.) ➔ Php code and sql queries for cancel booking (Customer is only allowed to cancel an event within 2 days.) ➔ Php code and sql queries for book events (Implemented logic so that customers cannot book events in the past date and year.) and assisted in other functionality . ➔ Done all CSS (Cascading Style Sheets) to make the website look more organized. ➔ Contributed ideas to enhance the project and to connect the database with proper codes. ➔ Participated in debugging the database functionality to ensure reliability and accuracy.
